CardIQ: show credit card users the money their cards leave on the table

Build **CardIQ** inside Paytm's credit card bill-pay flow, starting with **multi-card users who already pay their bills on Paytm**. Every bill cycle it tells them, in rupees, what each card earned, what it **missed** (wrong card used, milestone not reached, points about to expire) and the one action that fixes it.

The market is large and under-used	India has 12.53 crore credit cards [1] and about ₹2 lakh crore of card spend a month [2]. Issuance is growing faster than usage [3], so issuers need cards used, not just issued.
Benefits are too complex to track by hand	One co-branded card has 3 cashback tiers, monthly caps, a fee-waiver threshold and a milestone [13]. Milestone vouchers expire in 60 days and points lapse [12]. Enthusiasts track it all in Excel [11].
Paytm already holds the first data layer	Cards are not on the Account Aggregator network [7] and Google Play restricts SMS reading [9]. But every bill fetched through BBPS gives Paytm the issuer, statement amount and due date, with no new permission [5][6].
The fit with Paytm is natural	8.5 crore monthly transacting users; financial-services distribution revenue up 49% YoY [4]. CardIQ turns a monthly bill payment into a reason to stay, and opens a trusted, honest route to Paytm's co-branded and distributed cards.

V1	Card-variant wallet built from bill-pay history · monthly "earned vs missed" report · milestone, fee-waiver and expiry tracker · best card for this payment at Paytm checkout
Not V1	A full expense manager, SMS or email scraping, auto-redemption, card recommendations for revolvers

₹2–5k

left on the table per multi-card user per year **assumption**
to be validated in the concierge test

12.53 Cr
credit cards outstanding, Sep 2026 (RBI) [1]

₹2.02 L Cr
credit card spend, Aug 2026 (RBI) [2]

~₹16k
spend per card per month **inferred**
₹2.02 L Cr ÷ 12.4 Cr cards

How we will know it works

North Star	₹ value captured per active CardIQ user per month: rewards earned + fees waived + points and vouchers used before expiry, vs a matched control.
Business	Card bill-payer retention on Paytm at month 3 (+5 pp); cards per user paid on Paytm.
Kill signal	Under 10% of exposed users open the report after 8 weeks: it is a feature, not a habit. Fold it into bill pay; stop investing.

Working prototype: goku-143.github.io/paytm-cardiq. Switch the consent level and watch each screen change.

found source [n], Appendix A **inferred** reasoning, Appendix B

Nobody serves cardholders across all their cards, after issue, at low effort

Product	What it shows	What it asks you to share	How it makes money	Where it falls short	All my cards, after issue, at low effort?
CRED [10]	Bill reminders, "smart statements", hidden charges, duplicate spends, milestones	Card details; email access for statements	Lending (as a digital lending app), commerce, rewards marketplace	Heavy spenders find "rewards not worth it"; privacy worries over email access; no human support	All cards, but asks for your inbox
Bank apps e.g. HDFC MyCards [15]	Transactions, statements, points and redemption for that bank's cards	Nothing new: you are already a customer	Interchange, fees, interest	One issuer only, so never "use your other card here". Expiry is buried. A separate login per app [11]	One issuer only
Comparison sites BankBazaar, Paisabazaar	Card features and eligibility before you apply	Income, PAN, contact details	Referral fee per approved card	Stop at acquisition: nothing after the card is issued, no view of your actual spend	Stops before the card is issued
Enthusiast tools Excel, TechnoFino, SaveSage, Fold, CCreward [11]	Spend by card, milestones, points expiry, which card for which spend	Manual entry, or SMS/email access	Mostly free or niche subscription	Built for the 5+ card power user; too much effort for most. Users ask for "privacy-friendly, no SMS or email access"	All cards, but high effort
Paytm today [5][13][14]	Bill payment for 35+ banks via BBPS, gold coins, co-branded card benefit pages	Card number for bill fetch (BBPS)	BBPS fees, card distribution, co-brand economics	**Has the monthly bill moment and the bill data, but tells the user nothing about the card itself**	Pays all cards, but no insight
Paytm CardIQ target	Earned vs missed, milestones, waivers, expiry, best card at checkout	Nothing new to start (BBPS bill data); more only by choice	Retention, issuer campaigns, labelled card distribution	Long-tail card variants see only the Level 0 view at first	**All cards, no new permission**

What I took from it

Nobody owns **"after the card is issued, across all my cards"** at low effort. CRED comes closest but asks for your inbox.

Bank apps are trusted but single-issuer: "redeem before expiry", never "use your other card".

Power users have shown the job clearly (Excel trackers). The mass user won't do that work.

Paytm's edge is the **bill-pay moment plus BBPS bill data**. It can start with no new permission at all.

Method: app-store listings and reviews, issuer benefit pages and value charts, RBI, NPCI, PIB and Sahamati publications, Paytm's Q2 FY27 earnings, Reddit r/CreditCardsIndia and TechnoFino threads, and Paytm's own credit card bill-pay flow, used first-hand. I could not test CRED's email-linked statements without sharing my inbox, so that row is based on its listing and reviews.

Card value leaks every month, and the hard part is getting the data

1 · Value leaks: more cards, and benefits built to be hard to max out

More cards, less use per card

found Cards rose from 11.23 crore (Aug 2025) to 12.41 crore (Aug 2026), up about 10% [2]. Monthly spend is about ₹2.0–2.1 lakh crore [2][3]; CareEdge: "card issuance outpaces utilisation" [3].

inferred Spend per card is flat to falling, so issuers have reason to **pay for activation and usage**: a revenue route that needs no money from the user.

Benefits are hard to max out

found The Paytm HDFC card alone has 3%, 2% and 1% tiers with caps, a fee waiver at ₹5,000 a month and a 1% milestone on ₹10,000 a month [13]. Premium milestone vouchers expire in 60 days; users find out afterwards [12]. Points lapse silently [12].

inferred At ~₹16k per card per month, a 1 pp reward gap costs ₹160 a month per card. For a 2–3 card user, with unwaived fees: roughly **₹2–5k a year**.

2 · Data is the hard part: users guard their inbox, and the pipes are narrow

Users want help, not to hand over their inbox

found Forum users ask for a tracker "without SMS or email access" [11]. CRED reviewers question "sacrificing our privacy of sharing mail" [10]. Google Play limits SMS permissions to narrow financial uses [9].

inferred Ask for the **least data first**, show value, then ask for more: a consent ladder, not a consent wall.

The data pipes are narrower than they look

found Credit cards are **not** on the Account Aggregator network [7]. Third-party bill payment must run on BBPS since 1 July 2024 [6]. RBI tokenisation rules bar apps from storing card numbers [16].

inferred Usable sources: BBPS bill fetch (amount, due date, issuer), the user naming their card variant, statement PDF upload and, through partners, co-branded issuer data.

3 · Paytm owns the moment; honest advice can make it a relationship

Paytm owns the moment, not the relationship

found Paytm pays bills for 35+ issuers and rewards it with gold coins [5]. It has 8.5 crore monthly transacting users [4] and two co-branded cards, SBI and HDFC [13][14].

inferred Today the bill payment is a transaction; users can switch to CRED or the bank app for a better offer. Insight into their own cards is a **reason to come back** that a cashback war can't copy quickly.

Honest advice is the moat, and the risk

inferred The report that says "use your SBI card here" will one day say "a different card suits you better". If Paytm ranks cards by referral fee, users will notice and trust collapses. So: show the rupee math, label anything sponsored, and never push credit to users who revolve (pay only the minimum).

₹360–960 Cr

a year of value returned to users assumption

If 60–80 lakh people pay a card bill on Paytm each month and 25% become monthly CardIQ users, that is ~15–20 lakh engaged cardholders. At ₹200–400 a month captured each, that is the figure on the left. It is the trust story; Paytm's revenue comes from retention, issuer campaigns and honest card distribution (slide 7).

Data I would ask Paytm for: unique card bill payers per month, cards per payer, issuer and variant mix, days paid before due date, and bill payers lost to CRED or bank apps (Appendix B).

Multi-card users lose rewards they have already earned the right to

Who has the problem: segments of Paytm credit card bill payers

Segment	Cards	Behaviour	Core pain	Priority
A. Multi-card optimiser 25–40, metro or tier-1, salaried	2–4	Pays in full; a cashback card plus a rewards card, juggled by memory	Wrong card at checkout, missed milestones and fee waivers, expiring points	**V1 focus**
B. Single-card cashback user	1	Co-branded or entry card, mostly UPI and online	Doesn't know the caps; misses the fee-waiver threshold	V1 (served by the same report)
C. Points maximiser	5+	Excel, forums, transfer partners	Wants depth: transfer ratios, devaluations	Later: loud but small, and already served
D. Revolver / stretched	1–3	Pays minimum due, high utilisation	Interest cost, debt stress	Not in V1: needs a different, careful product

Segment A's job, and where it breaks today

1. Choose a card at checkout

"Which card gives 5% on Swiggy again?" Picks the default card and earns 1%.

2. Hit the threshold

Doesn't know they are ₹6,000 short of a ₹1,000 voucher or a fee waiver. Finds out after the year resets [12].

3. Use what was earned

Points and vouchers expire. Each bank app shows it differently, behind its own login [11][15].

4. Pay the bill

On Paytm: the one moment all the cards come together. Today it ends at "Payment successful".

What one segment A user leaves behind

~₹16k spend per card a month `inferred`

× **1 pp** reward gap = **₹160** per card a month

× **12** × **2–3** cards = **₹3.8–5.8k**, ± fees and optimised cards

₹2–5k a year `assumption`
tested in Test 2

Scale: ~15–20 lakh engaged users, 25% of 60–80 lakh payers `assumption`

Persona: Rohan, 29, Bengaluru

A composite from forum and review patterns

Product analyst. Holds 3 cards: cashback, rewards, and the one linked to UPI. Pays all three bills on Paytm a few days before the due date. Last year his rewards card reset its milestone two weeks before he would have crossed it. He has 2,400 points expiring that he doesn't know about.

"I don't want another budgeting app. Just tell me which card to use, and warn me before I lose something."

Why this problem first

- **Money, not charts:** every insight is rupees kept; shareable and measurable.
- **It rides an existing habit:** the monthly bill-pay moment Paytm already has.
- **It works with minimal data:** milestones, waivers and expiry need only the variant and bill totals.
- **It builds the trust** that later monetisation needs (slide 7).

Not solving yet: budgeting (crowded, weak habit, needs all transaction data); debt help for D (high value but sensitive; own guardrails, never mixed with card selling); points transfers for C (deep but niche).

CardIQ is a monthly card coach inside bill pay that needs no new permission to start

1. My cards

Cards auto-listed from bill-pay history. Confirm the variant (e.g. "Bank A CashPlus") in one tap from the issuer's list.

Data: BBPS biller and last-4 (already held) + user's pick

→

2. Earned vs missed report

At each bill: "You earned ₹1,419. You missed ₹336." Split by card, with the single biggest fix.

Data: statement categories (PDF upload, parsed on the phone) + benefits library

→

3. Milestones, waivers, expiry

Progress bars and countdowns: "₹6,200 more by 14 Jan waives your ₹1,000 fee". Points and vouchers expiring in 30 days.

Data: variant + statement totals; anniversary date from the user once

→

4. Best card for this payment

At Paytm checkout (bills, recharges, merchant UPI on card): "Use ShopMore: +₹54 (vs +₹27 on your default card)."

Data: merchant category (Paytm knows it) + library + progress

Starts on the bill-pay success screen (BBPS, as today) and repeats every bill cycle

The consent ladder: each level adds more

Level	User shares	What CardIQ can then show
0 · no new consent	Due dates, statement totals, issuer	**Approximate waiver and milestone progress, for every bill payer**
1 · one tap	Picks the card variant	**Exact benefits, caps, milestone rules**
2 · upload	Statement PDF; password typed and parsed on the device; only category totals stored	**Earned vs missed**
3 · opt-in later	Read-only link to issuer statement emails only, revocable anywhere	**Automatic monthly reports**

Not used: SMS reading (Play policy limits it [9]; it feels invasive). Account Aggregator does not cover cards today [7]; plug it in when issuers join.

Design factors and how they shape the build

Trust — Show the math behind every rupee ("2% × ₹2,700 = ₹54"), a "last verified" date on each benefit rule, and a way to report wrong data.

Privacy — Data minimisation and purpose limitation under the DPDP Act and Rules 2025 [8]. Statements deleted after parsing. One screen shows and revokes every consent.

Regulation — No card numbers stored (tokenisation [16]); bills only via BBPS [6]; referrals follow DSA (direct selling agent) disclosure norms; no credit offers to revolvers.

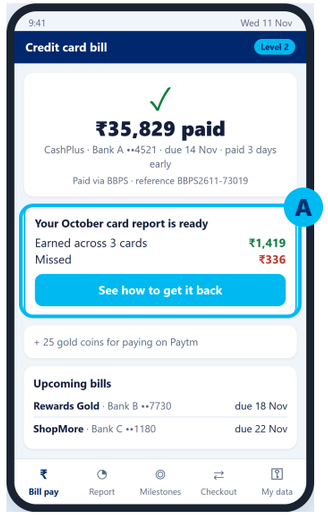

Monetisation — Never paid by the user: retention, issuer-funded activation and honestly labelled card distribution (slide 7).

In V1 — Benefits library for the **top 25 card variants** (assumed to cover most Paytm bill payers; to be validated with Paytm's variant mix) · the 4 features above, for segments A and B · report on the success screen + one push before the due date · Paytm co-branded cards (SBI, HDFC) fully supported first

Left out — Auto-redemption and points transfer · "get a better card" recommendations (V2, once trust metrics hold) · budgets, net worth, full transaction feed · revolver and debt tools · email link (Level 3) until Level 2 proves value

In one bill cycle, Rohan sees ₹336 missed and exactly how to get it back

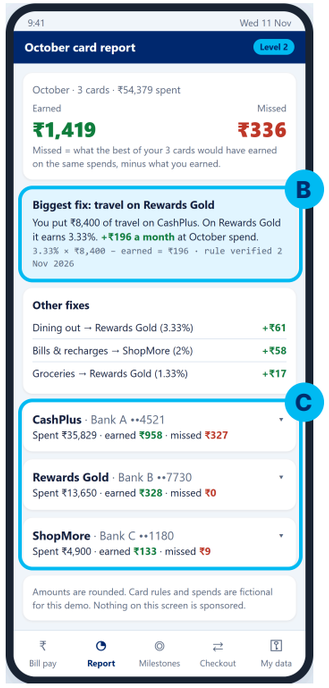

1 Pays his bill, as today

A Report ready on the success screen: earned **₹1,419**, missed **₹336**.

Entry point: the screen he already sees every month. No new habit needed.

2 Sees what he missed, and why

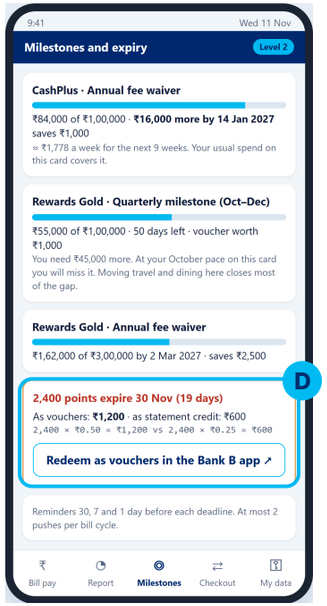

B Biggest fix: travel → Rewards Gold, **+₹196** a month, with its formula.

C Earned / missed CashPlus **₹958 / ₹327** Rewards Gold **₹328 / ₹0** ShopMore **₹133 / ₹9**

Needs Level 2 (statement upload, parsed on the phone). Before that, he sees the Level 0 view.

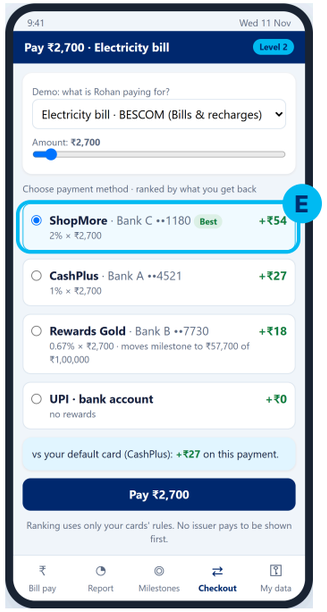

3 Tracks milestones and expiry

D **2,400 points** expire 30 Nov: **₹1,200** as vouchers vs ₹600 as statement credit.

Fee waivers and milestones work from Level 1; points expiry needs a statement. Redemption hands off to the issuer.

4 Gets the best card at checkout

E ShopMore **+₹54** vs **+₹27** on his default card, for a ₹2,700 bill.

Frequency driver: works on every Paytm bill, recharge and credit-card-on-UPI payment.

What makes it trustworthy: every number shows its formula and the date its benefit rule was verified · nothing is sponsored in V1 · one consent screen with "delete my statement data" · redemption always happens in the issuer's app (Paytm never touches points). Banks, cards and amounts are fictional.

Clickable prototype:
goku-143.github.io/paytm-cardiq

Success means users keep ₹150+ a month more and bill payers stay on Paytm

North Star

₹ captured per active CardIQ user per month

Rewards + fees waived + points and vouchers used before expiry, vs a matched control

≥ ₹150

uplift target at 6 months

Under ₹50: the advice is not worth acting on. Deepen the library.

Inputs · adoption

Card setup rate — **≥ 40%**
Bill payers who confirm ≥ 1 card variant (Level 1)
Low: fix the picker or auto-detect

Statement link rate — **≥ 20%**
Level-1 users who upload ≥ 1 statement (Level 2)
Low: lean on Level 0–1; test email opt-in sooner

Inputs · habit and behaviour

Monthly report open rate — **≥ 25%**
Exposed users who open the report in a bill cycle
Under 10% at week 8: fold into bill pay (kill signal)

Milestone completion — **+15 pp**
Users at ≥ 70% of a milestone who complete it, vs control
Proves nudges change behaviour, not just inform

Points lapsed — **−30%**
Points and vouchers expiring unredeemed per user
Expiry alerts work; tune timing

Business proof

Bill-pay retention — **+5 pp**
Card bill payers still paying on Paytm at month 3
The core reason to fund it

Cards paid on Paytm per user — **+0.3**
Distinct cards whose bills a user pays on Paytm
Wallet share won from CRED and bank apps

Guardrails

Trust and consent — **<5% · <1% · <10%**
Consent revoked · "wrong number" reports · push opt-outs
A breach pauses rollout. Accuracy beats growth.

Targets are 6-month hypotheses, to be reset after the concierge test.

Unit economics per engaged user: the user keeps ₹200–400 a month `assumption` and pays ₹0 · Paytm earns retention (+5 pp target) and wallet share (+0.3 cards paid) · issuers fund activation campaigns.

How it ties into Paytm's credit card business

Bill pay [5] is the entry point and data source. Paytm becomes the place you *want* to pay, not just the cheapest.

Co-branded cards (Paytm SBI, HDFC) [13][14] come first: partner data, richer reports, "earn more on Paytm" in rupees.

Card distribution [4]: a V2 "card fit check" shows what actual spend would earn on another card; sponsored placements labelled.

Credit card on UPI (RuPay) [17]: the checkout nudge also works on UPI payments made with a credit card.

Who pays

Paytm funds it as a retention feature: bill-payer retention, wallet share.

Issuers fund opt-in activation ("₹500 back on your first ₹5k"): issuance outpaces use [3].

Issuers, V2: referral fee per approved card, for better-qualified applicants with actual spend fit.

The user never pays. Free; paying would kill the trust story.

Three cheap tests in 8 weeks decide whether CardIQ earns a full build

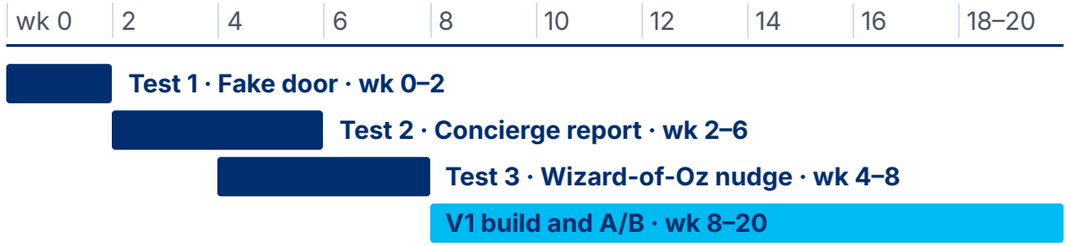

Trade-offs I am choosing deliberately

I choose…	…over	What I give up
Privacy-light consent ladder	Email access from day 1	Fewer full reports early; slower "wow"
Monthly bill moment + checkout nudge	A daily-engagement app	Lower frequency, but it matches the real job
Top 25 variants, done right	All 300+ variants, roughly	Long-tail cards see only the Level 0 view
Honest, neutral advice	Ranking by referral fee	Short-term distribution revenue
Segments A and B	Power users and revolvers	The most vocal users wait for V2

Risks and mitigations

Risk	Mitigation
Wrong benefit data breaks trust (issuers change T&Cs often)	Versioned library, "verified on" date, weekly issuer-page check, one-tap "this is wrong", formula shown
Issuer pushback on users gaming milestones	Position it as activation: issuers get aggregated insight and paid campaigns. Start with co-brand partners
Regulatory: DPDP consent, tokenisation, DSA rules	Purpose-bound consent [8], no card numbers stored [16], disclosures on referrals, legal review before V2
Statement parsing fails across 35+ formats	Top issuers' formats first; fall back to an "enter 3 numbers" manual mode
Nudges feel like spam	Cap at 2 pushes per cycle; opt-out guardrail < 10%

Test plan: learn cheaply, then build

Test 1 · Fake door. A "See what your card earned you" tile on the bill-pay success screen for 5% of payers; tapping opens a waitlist. **Pass:** ≥ 5% tap-through and ≥ 40% join the waitlist. **Learn:** which issuers or segments care most.

Test 2 · Concierge report. 150 waitlisted users upload one statement; an analyst builds the earned-vs-missed report in a spreadsheet and sends it in-app. **Pass:** median leakage ≥ ₹200 a month, and ≥ 40% act on one tip in the next cycle (checked on the next statement). **Learn:** which of the 4 features matters; real ₹ numbers to replace my assumptions.

Test 3 · Wizard-of-Oz checkout nudge. Co-branded cardholders only: "best card" from a hand-built rules table. **Pass:** ≥ 15% switch cards when nudged, with no rise in payment drop-off.

Then · V1 build and A/B. Top 25 variants. Bill payers randomised 50/50 by user. Primary metric: month-3 bill-pay retention; secondary: ₹ captured; guardrails as on slide 7.

Rollout after the A/B: co-branded cards → top 25 variants → email opt-in (Level 3) → V2 "card fit check" with labelled sponsorship, only if consent revokes stay under 5% and "wrong number" reports under 1%.

All web sources were accessed in November 2026. Figures marked "found" in the deck are as reported by these sources. Everything marked "inferred" or "assumption" is my own and is listed in Appendix B.

Appendix B · Assumptions, how I got them, and the data I would ask Paytm for

Assumption	How I arrived at it	Data to ask Paytm for	If it is wrong…
~₹16k spend per card per month	₹2.02 lakh crore (Aug 2026) ÷ 12.4 crore cards [1][2]. Skewed: many dormant cards, a few heavy ones	Statement-amount distribution of bills paid on Paytm	Leakage ₹ scales with it. Re-target to higher-spend payers first
Multi-card users hold 2–3 cards	Forum and persona patterns [11][12]; the cards-per-holder ratio isn't published	Distinct cards paid per user per quarter	If most hold 1, lead with fee waiver and caps (segment B), not "which card"
₹2–5k per year left on the table	1 pp reward gap × ₹16k × 12 × 2–3 cards = ₹3.8–5.8k; plus fees, less cards already optimised	Validated by the concierge test (Test 2)	Below ₹1k a year: the report isn't worth opening, so pivot to expiry alerts only
60–80 lakh monthly credit card bill payers on Paytm	Not published. A placeholder share of third-party bill payment, given 8.5 crore MTU [4]	Actual monthly unique payers	Changes the size of the prize, not the decision
Top 25 variants cover most payers	Issuer concentration: HDFC, SBI, ICICI and Axis dominate card spend [2]	Variant mix from BBPS billers plus the variant picker	Expand the library before launch; long tail stays at Level 0
20% will upload a statement	Upload is a one-time effort that pays off visibly. Benchmark for the concierge test	Measured in Test 2	Lean on Level 0–1 features; trial the email opt-in sooner
Issuers will fund activation campaigns	"Issuance outpaces utilisation" [3]; co-brand partners already fund Paytm-specific cashback [13][14]	Partnerships team view; a pilot with one co-brand partner	Monetise through retention only; V2 distribution carries the revenue

Appendix C · User conversations: interview guide and findings

Interview guide (20 min, 8–10 users who hold 2+ credit cards)

1. Which cards do you hold, and how do you decide which one to use for a payment?
2. Walk me through the last time you paid a card bill. Which app, and why that one?
3. Do you know your card's milestone or fee-waiver threshold? When did you last check?
4. Have you ever lost points, a voucher or a milestone benefit? What happened?
5. How do you track rewards today (bank app, CRED, Excel, nothing)?
6. Would you upload a statement to see what you missed? Would you link your email? Why or why not?
7. If an app told you "use card X here, +₹54", would you trust it? What would make you trust it?
8. If that app also suggested a new card, how would you feel?

Recruit from classmates, family and alumni with 2+ cards. Include at least 2 single-card users and 1 power user as contrast.

Findings: fill in from your interviews before submitting
